Name: LAKSHITH.S	Age/Gen: 3 months/M	Date: 11.02.2023
Hospital ID: I23005703	Study ID: DMSA2302024	
Ref. by: DR PAVAI		

Tc-99m DMSA RENAL CORTICAL SCINTIGRAPHY

Clinical history: PUV, post fulguration (17.01.2023). USG (10.02.2023) – Bilateral hydroureteronephrosis.

Procedure:

Tc-99m DMSA was administered through intravenous cannula followed by acquisition of spot images of abdomen in posterior, anterior and oblique views after two hours.

Findings:

Overall background activity is elevated.

Left kidney: appears normal in size, shape and location. It shows mildly impaired tracer uptake with regular cortical outline and areas of photopenia in upper, mid & lower polar regions.

Right kidney: appears normal in size, shape and location. It shows mildly impaired tracer uptake with regular cortical outline and small area of photopenia in lower polar region.

Faint tracer activity seen in the region of both ureters.

Differential function:

Left kidney	Right kidney
46%	54%

PSG HOSPITALS

DEPARTMENT OF NUCLEAR MEDICINE

IMPRESSION:

- Mildly impaired function of left kidney with areas of inflammatory changes in upper, mid & lower polar regions.
- Mildly impaired function of right kidney with small area of inflammatory changes in lower polar region.

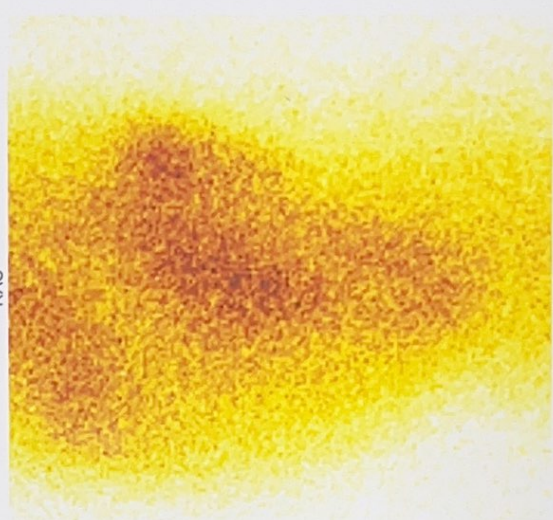

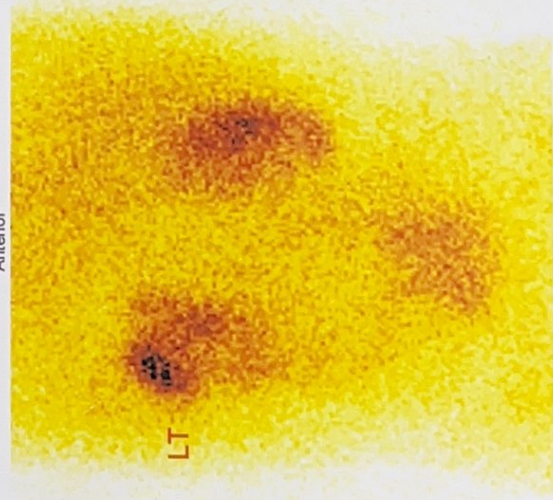

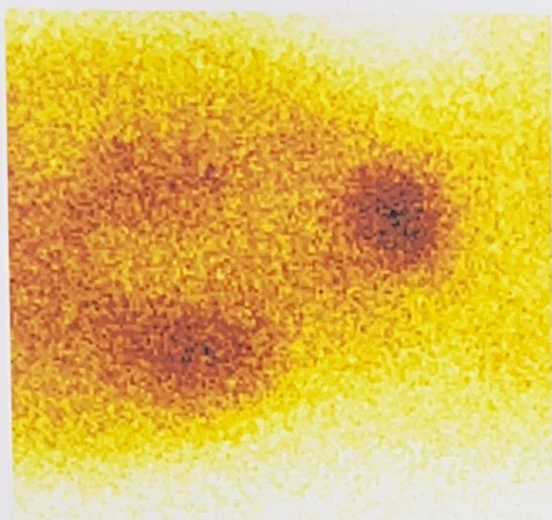

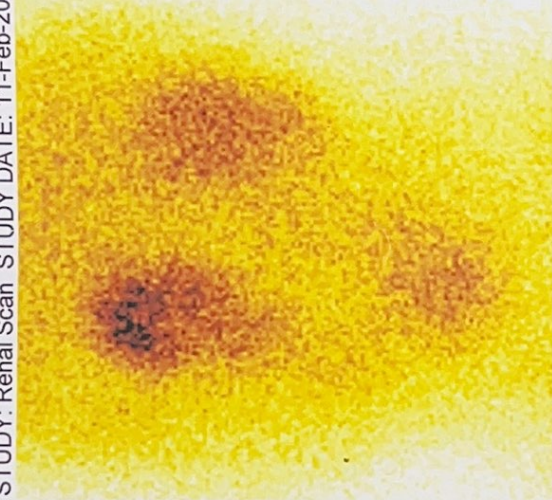

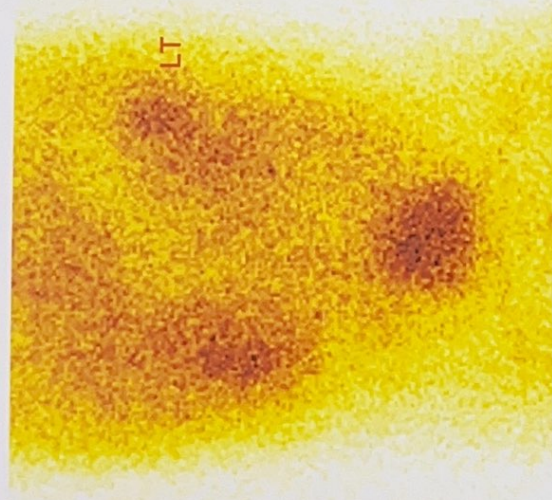

Suggested clinical/ radiological correlation and follow up.
